Tools Required

- Rubber Mallet
- Hacksaw or Dropsaw (for more clean cut)
- Tape Measure

Handy Hints

- To make the joins permanent use an adhesive on the inside of the tube
- Use a rubber mallet or a block of some sort to protect the tube from damage when tapping together

Cut customised lengths from pre-cut lengths

Cuts

- 2 x 600mm lipped tube (use 1 x 1200mm length)
- 4 x 287mm square tube (use 1 x 1200mm length)
- 4 x 800mm square tube (use 2 x 1800mm length, left over 2x200mm to be used for bottom legs)
- 2 x 200mm square tube (use 1 x 450mm)

No Cutting Required

- 2 x 1800mm lipped tube
- 1 x 1800mm square tube

Hint: Clamping securely will assist in making more accurate and squarer cuts. After cutting, deburr or file clean and square up the ends.

Layout Lengths and Joiners grouped by size

Hint: Place lengths and joiners out so you have an idea of what order they will need to be assembled in

Assemble frame

- Start from the bottom
- Assemble the vertical lengths first using the joiners
- Join square and lipped tubes by tapping the pieces together with the specified impact resistant joiner (refer to diagram for lengths and joiners to use)

Hint: Do not finally tap together profiles to joiners until you are sure of everything.

Add Shelf

- Use mdf board, timber or whatever material you choose for your shelves
- **Shelf Size:** 1800 x 600mm
- **Lipped Tube** Turn it one way and the shelf can be up to 6mm, or simply turn it the other way, and it can be 17mm thick. Make sure the lip is positioned correctly for your sized shelf.

Hint: With shelves allow a little wiggle room so they are not too tight
